PROVABLE VAT DETERMINATION

Get VAT right, and prove it.

VATmiraal determines the correct VAT treatment for every transaction and shows the legal reasoning behind it. **Every answer is one you can defend.**

Walk into a VAT audit with the answer already written.

Every determination carries the legal reasoning that produced it, generated the moment the decision is made. When an auditor asks why a rate, an exemption, or a deduction applies, the justification is already on file, traceable to the law it rests on.

Stop losing input VAT, and stop over-claiming it.

With mixed and partial deduction, pro-rata, and capital-goods revision, money quietly leaks in both directions. Under-deduction is cash you never recover; over-deduction is an adjustment waiting for an inspector to find.

Automate what's certain. Escalate only what isn't.

Most transactions have one correct treatment, and the system can prove it. The few that do not usually fail because an input is missing, not because the law is unclear. That way your team spends its attention only where judgment is genuinely required.

Your books know when your master data no longer adds up.

When the same service is supplied to the same client yet taxed two different ways over time, one of the inputs behind those bookings must differ: a fact about the client has drifted from reality, or one booking was wrong from the start. VATmiraal reads the posted history backward, points to the attribute that must have moved, and reconciles it against your records.

Be ready for real-time reporting before you have to be.

Belgian e-reporting and EU-wide digital reporting turn VAT from a periodic filing into a transaction-by-transaction obligation. Once a determination flows into a real-time submission, a wrong answer is no longer something you quietly correct next quarter.

See where you're about to owe VAT in another country.

Cross-border activity creates registration and threshold obligations that are easy to cross without noticing. VATmiraal is designed to track that exposure by jurisdiction, so a threshold becomes a planned decision rather than a surprise after the fact.

See it decide, and explain itself, on your own transactions.
