WHAT'S COMING

The tax authority will see your VAT in real time.

Peppol was the warm-up. What comes next, e-reporting and real-time reporting, turns VAT into a matter of the moment itself. **The question is whether you will know your position as well as the tax authority does.**

Peppol is the channel, not the destination.

Belgian e-reporting from 2028 and EU-wide real-time reporting from 2030 turn VAT from a periodic filing into a transaction-by-transaction obligation. Control after the fact becomes continuous observation.

The chain weaves in, not just the invoice.

With the Peppol order messages (Order BIS), order, delivery and invoice move together into one structured flow. It is precisely those ordering and transport details that often drive the VAT treatment, even though they appear nowhere on the invoice.

Restore the balance.

If the tax authority sees your position in real time, you cannot afford for it to know that position better than you do. The role of anyone working with VAT shifts with it: from adviser after the fact to someone who follows the invoicing and logistics flows continuously.

An answer that holds, at the moment itself.

VATmiraal determines the VAT treatment and shows the legal reasoning behind it, traceable to the law. Once it enters a real-time submission, it is an answer you can defend, not something you correct the following quarter.

Reasoned from the facts, not guessed.

The input determines the answer. Where the data allow it, you get a substantiated answer; where they fall short, an explicit notice that the input is insufficient. No guesswork in between, and the choice stays with you.

The data the invoice does not carry.

Transport, chain role and origin help determine the treatment, but do not appear on the invoice itself. VATmiraal draws them from the order and transport flows and from its own enriched master data, so the determination is right before it enters the flow.

Be ready before you have to be, on your own transactions.
